PLSC 503 – Spring 2018 Transformations

February 22, 2018

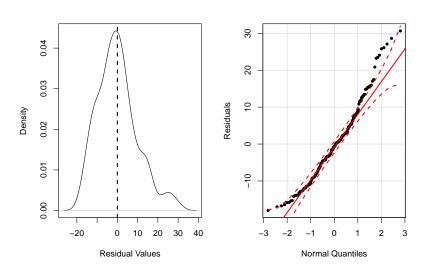

Why Transform?

- Linearity
- Additivity
- Normality (of u_i s)
- Interpretation / Model Specification

What Difference Does It Make? (Part I)

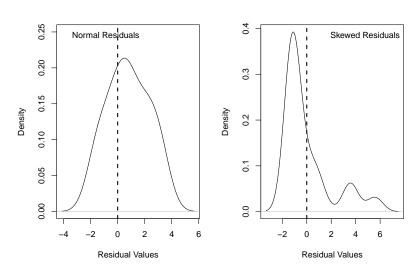

Residuals Are Still (Pretty) Normal...

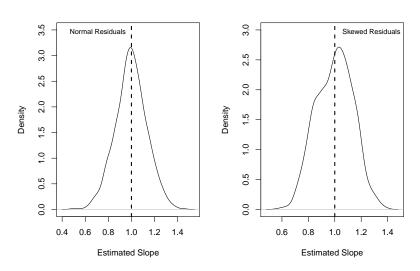

What Difference Does It Make? (Part II)

```
N <- 20 # sample size
u \leftarrow rnorm(N,0,2) \# mean zero, s.d = 2
# Exponentiate:
eu \leftarrow exp(u)
eu <- eu-mean(eu) # new residuals are mean-zero
eu \leftarrow (eu/sd(eu))*2 \# and also sd = 2
X \leftarrow runif(N.-6.6)
Y1 < -0 + 1*X + 1*11
Y2 <- 0 + 1*X + 1*eu # same Xs in both
```

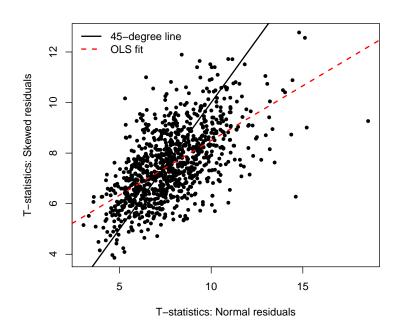

What Difference Does It Make? (Part II)

Little Effect On $\hat{\beta}$

Important Differences in Inference

Examples

This:

$$Y_i = \beta_0 X_i^{\beta_1} u_i$$

becomes this:

$$\ln(Y_i) = \ln(\beta_0) + \beta_1 X_i + \ln(u_i)$$

And this:

$$\exp(Y_i) = \beta_0 + \beta_1 X_i + u_i$$

becomes this:

$$Y_i = \ln(\beta_0) + \beta_1 \ln(X_i) + \ln(u_i)$$

Monotonic Transformations

The "Ladder of Powers":

Transformation	p	f(X)	Fox's $f(X)$
Cube	3	X^3	$\frac{X^{3}-1}{3}$
Square	2	X^2	$\frac{X^2-1}{2}$
(None/Identity)	(1)	(X)	(\dot{X})
Square Root	$\frac{1}{2}$	\sqrt{X}	$2(\sqrt{X}-1)$
Cube Root	1/2 1/3	$\sqrt[3]{X}$	$3(\sqrt[3]{X}-1)$
Log	0 (sort of)	ln(X)	ln(X)
Inverse Cube Root	$-\frac{1}{3}$	$\frac{1}{\sqrt[3]{X}}$	$\frac{\left(\frac{1}{\sqrt[3]{X}}-1\right)}{-\frac{1}{3}}$
Inverse Square Root	$-\frac{1}{2}$	$\frac{1}{\sqrt{X}}$	$\frac{\left(\frac{1}{\sqrt{X}}-1\right)}{-\frac{1}{2}}$
Inverse	-1	$\frac{1}{X}$	$\frac{\left(\frac{1}{X}-1\right)}{-1}$
Inverse Square	-2	$\frac{1}{X^2}$	$\frac{\left(\frac{1}{X^2}-1\right)}{-2}$
Inverse Cube	-3	$\frac{1}{X^3}$	$\frac{\left(\frac{1}{X^3}-1\right)}{-3}$

A General Rule

Using higher-order power transformations (e.g. squares, cubes, etc.) "inflates" large values and "compresses" small ones; conversely, using lower-order power transformations (logs, etc.) "compresses" large values and "inflates" (or "expands") smaller ones.

Power Transformations: Two Issues

1. X must be positive; so:

$$X^* = X + (|X_I| + \epsilon)$$

with (CZ's Rule of Thumb):

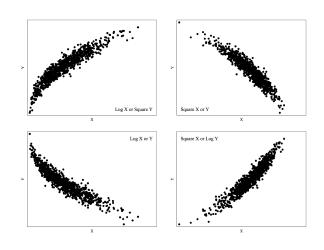

$$\epsilon = \frac{X_{l+1} - X_l}{2}$$

2. Power transformations generally require that:

$$\frac{X_h}{X_l} > 5$$
 (or so)

Which Transformation?

Mosteller and Tukey's "Bulging Rule":

Nonmonotonicity

Simple solution: Polynomials...

• Second-order / quadratic:

$$Y_i = \beta_0 + \beta_1 X_i + \beta_2 X_i^2 + u_i$$

• Third-order / cubic:

$$Y_{i} = \beta_{0} + \beta_{1}X_{i} + \beta_{2}X_{i}^{2} + \beta_{3}X_{i}^{3} + u_{i}$$

• *p*th-order:

$$Y_i = \beta_0 + \beta_1 X_i + \beta_2 X_i^2 + \beta_3 X_i^3 + \dots + \beta_p X_i^p + u_i$$

Transformed Xs: Interpretation

For:

$$ln(Y_i) = \beta_0 + \beta_1 X_i + u_i,$$

then:

$$\mathsf{E}(Y) = \exp(\beta_0 + \beta_1 X_i)$$

and so:

$$\frac{\partial \mathsf{E}(Y)}{\partial X} = \exp(\beta_1).$$

Transformed Xs: Interpretation

Similarly, for:

$$Y_i = \beta_0 + \beta_1 \ln(X_i) + u_i$$

we have:

$$\frac{\partial \mathsf{E}(Y)}{\partial \ln(X)} = \beta_1.$$

So doubling X (say, from X_{ℓ} to $2X_{\ell}$):

$$\Delta E(Y) = E(Y|X = 2X_{\ell}) - E(Y|X = X_{\ell})$$

$$= [\beta_{0} + \beta_{1} \ln(2X_{\ell})] - [\beta_{0} + \beta_{1} \ln(X_{\ell})]$$

$$= \beta_{1}[\ln(2X_{\ell}) - \ln(X_{\ell})]$$

$$= \beta_{1} \ln(2)$$

Log-Log Regressions

Specifying:

$$ln(Y_i) = \beta_0 + \beta_1 ln(X_i) + ... + u_i$$

means:

Elasticity_{YX}
$$\equiv \frac{\%\Delta Y}{\%\Delta X} = \beta_1$$
.

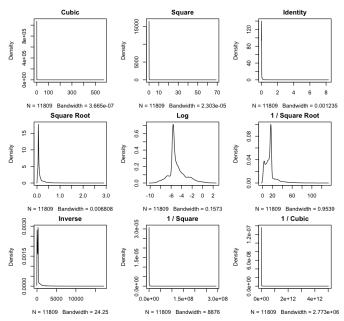

IOW, a one-percent change in X leads to a $\hat{\beta}_1$ -percent change in Y.

An Example: Military Spending and GDP

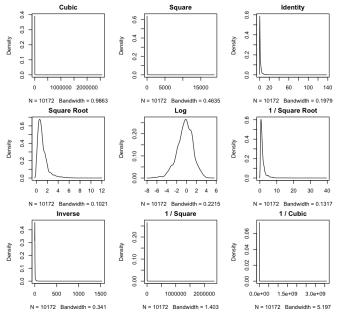

Data are from Fordham and Walker...

```
> with(Data, summary(milgdp))
  Min. 1st Qu. Median Mean 3rd Qu. Max. NA's
  0.000  0.238  0.749  2.115  2.104 136.900  4327
> with(Data, summary(gdp))
  Min. 1st Qu. Median Mean 3rd Qu. Max. NA's
  0.0001  0.0033  0.0047  0.0534  0.0153  8.3010  2690
```

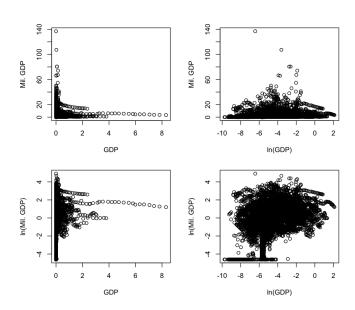

"Ladder of Powers": GDP

"Ladder of Powers": Military Spending

Scatterplots

Untransformed:

Logging *X*:

Logging Y:

```
Coefficients:

Estimate Std. Error t value Pr(>|t|)

(Intercept) -0.45918    0.01669 -27.51 <2e-16 ***
gdp     0.75794    0.05343    14.18    <2e-16 ***
---

Signif. codes: 0 *** 0.001 ** 0.01 * 0.05 . 0.1    1

Residual standard error: 1.651 on 10170 degrees of freedom (4327 observations deleted due to missingness)

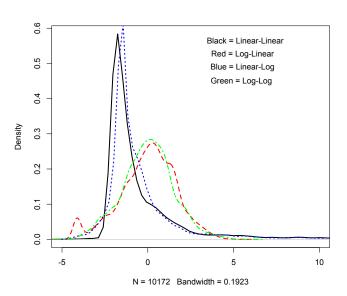

Multiple R-squared: 0.0194, Adjusted R-squared: 0.0193
F-statistic: 201.2 on 1 and 10170 DF, p-value: < 2.2e-16
```

> with(Data, summary(lm(log(milgdp+0.01)~gdp)))

Logging X and Y:

> with(Data, summary(lm(log(milgdp+0.01)~log(gdp))))

Density Plots of \hat{u}_i s

Transformation Tips

- Theory is valuable.
- Try different things.
- Look at plots.
- It takes practice.
